THE CONCEPT OF E-ADMINISTRATION IN THE HUNGARIAN REGULATION

Zsolt CZÉKMANN[*]
Lilla Nóra KISS[**]

ABSTRACT: *The appearance and the spread of the information technology and the availability of the e-services opened up a new chapter "within the history and relationship between the EU and its citizens by providing a new quality of relationship- and service system"(Lapsánsky, 2013, p. 352)(Veszprémi B., Czékmann Zs., 2013).The appearance of information technology can be dated to the XX. century. In the beginning, the technology formed the business and private sphere by providing new technological tools in the starting and maintaining of relationships. This process fastened and developed and nowadays the business and private sector can reach services electronically provided by the administrative sphere in order to keep contact with the state. The electronization process of the public sphere and the administration is a huge step forward which formed and transformed the role of the state as well.*
The topic of my paper is this smaller but significant part of information technology, the e-services having a special regard to the situation in the European Union (hereinafter referred to as: EU), especially in Hungary.

KEYWORDS*: e-services,e-administration, EU, Hungary, IT*
